»—DICKSON'S—« CHAMPION TRANSOM ✦ LIFTER.

The only lifter in the market that is UNIVERSAL in its adaptability to meet all requirements, as in its one for n it operates sashes centrally pivoted, and swings OUT or IN those hinged at either TOP or BOTTOM, and in every case for RIGHT OR LEFT HAND.

MANUFACTURED BY
PALMER HARDWARE MF'G CO.,
TROY, N. Y.

Cheapest for the Builder.—Because it is easier to apply than any other, and when applied needs no further attention.

It is sure to suit the house owner and is a credit to the builder applying it. Its adaptability to a wide range of lateral adjustments makes it unnecessary to put it where it would disfigure the moulding.

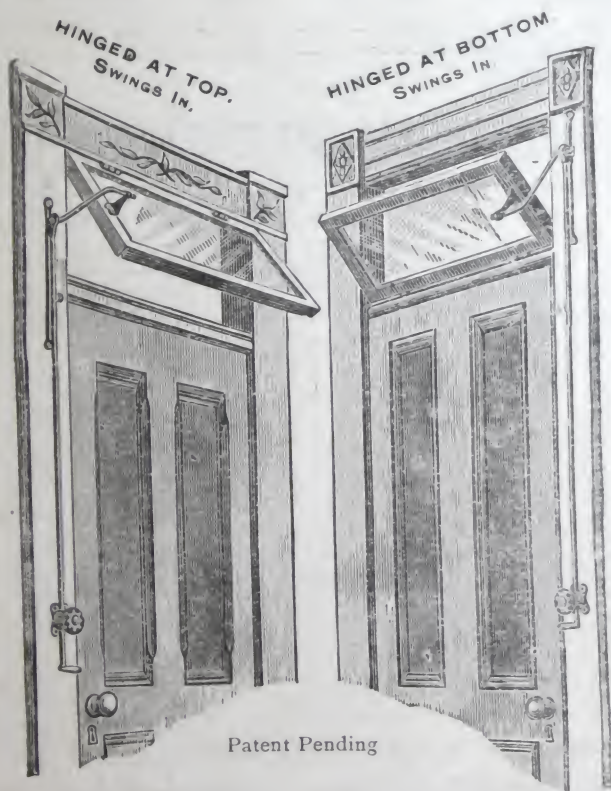

Best for the House Owner.—Because it is the strongest and handiest, and being made on true mechanical principles its application cannot be faulty, and when applied will last as long as the building, and work perfectly and easy. All bearings are perfectly fitted and are solid and substantial. The locking-screw holding the rod in position is a positive clamping device, and will never mar the rod, and makes unnecessary any holes or notches, as it positively fastens in any position.

The Architect's Choice.—Because, beside his appreciation of the advantages already enumerated, he sees that its use makes practical a system of ventilation long sought and never heretofore attained, namely, that secured by throwing the sash from the inside outward.

The Merchant's Choice.—Because he knows it is what his trade wants and will buy, and because he is saved a great part of the detail (the bane of the business in all others), as while he has one of the Champion on hand he has one that will meet the requirements of any class, consequently he needs to carry only a fraction of the stock heretofore necessary.

Dicks's Champion Transom Lifter is the invention of a practical man, having a thorough knowledge of the requirements of devices of its class.

The result is a device entirely new in all its features. All pivots are threaded making a perfectly solid bearing and at the same time providing means for many changes and adjustments.

It is the only transom lifter in the market that swing a transom out of the room, a feature long sought by architects.

It is also the only lifter that in only one form will fill the requirements of all classes and that will apply to deep recesses without special brackets.

EVERY LIFTER CAN BE USED FOR EITHER RIGHT OR LEFT HAND

A torsion spring is provided when wanted (but is not included in the outfit) that effectually prevents the breaking of glass. This is applied between the lever and bracket and is of varying stiffness. Its effect begins as soon as the transom begins to open, the resistance increasing as it opens.

The locking screw is non-detachable and is a perfect clamp, no holes or notches in the rod being necessary, and no abrasions of the rod can result from its use.

This lifter is comparable with all others only by contrast. A practical man has only to see it to be convinced that it is certain to supercede all others.

PRICE-LIST
